

## Congressman Henry Cuellar TX-28 - Effective Border Security Infrastructure Incorporating Local Input

The Laredo Area Bulkhead is a project that would serve as a dual purpose border security solution along the Rio Grande River to both enhance border security and provide flood control benefits to the surrounding community. Washington should not impose a one-size-fits-all border security infrastructure solution on border communities with diverse and unique needs. This project represents a potential collaborative effort between the Department of Homeland Security, state and local officials, and other stakeholders to provide an effective border security solution suited to the community's individual needs.
